Problem 1

##

Subset the HMPv35 object to obtain only the samples from Tongue_dorsum. Call this new object HMPv35sub2

```
# Fill in your code to subset
sub <- get_variable(HMPv35, "HMPbodysubsite") %in% c("Tongue_dorsum")
sample_data(HMPv35)$sub <- factor(sub)
# Call the new object HMPv35sub2
HMPv35sub2 <- prune_samples(sample_data(HMPv35)$sub == TRUE, HMPv35)
summary(sample_data(HMPv35sub2))</pre>
```

```

Problem 2

Produce the geometric box plot of diversity measures for your object, HMPv35sub2

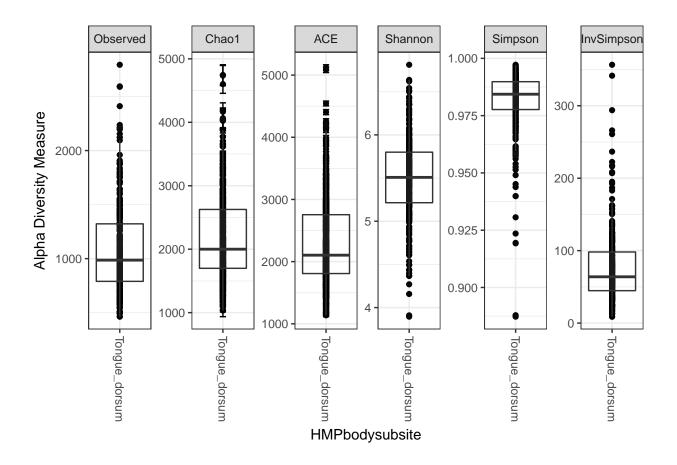

```
theme_set(theme_bw())
#The following commands plot the different diversity measures for the two different body sites.
alpha_meas = c("Observed", "Chao1", "ACE", "Shannon", "Simpson", "InvSimpson")
(p <- plot_richness(HMPv35sub2, "HMPbodysubsite", measures=alpha_meas))</pre>
```

Warning: Removed 1264 rows containing missing values (geom_errorbar).

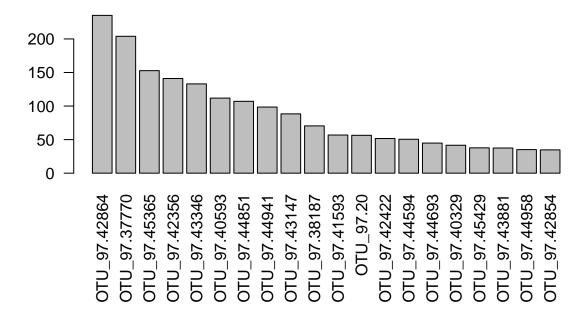

```
p + geom_boxplot(data=p$data, aes(x=HMPbodysubsite, y=value), alpha=0.1)
```

Warning: Removed 1264 rows containing missing values (geom_errorbar).

You see what taxa are most prevalent in your subset, HMPv35sub2

```
ntaxa(HMPv35sub2)
## [1] 45336
par(mar = c(10, 4, 4, 2) + 0.1)
N <- 20
barplot(sort(taxa_sums(HMPv35sub2), TRUE)[1:N]/nsamples(HMPv35sub2), las=2)</pre>
```

Using your HMPv35sub2 object, throw the rare taxa out of that object, then reduce to only taxa in the phylum Bacteroidetes. Call this new object HMPv35sub2frbac

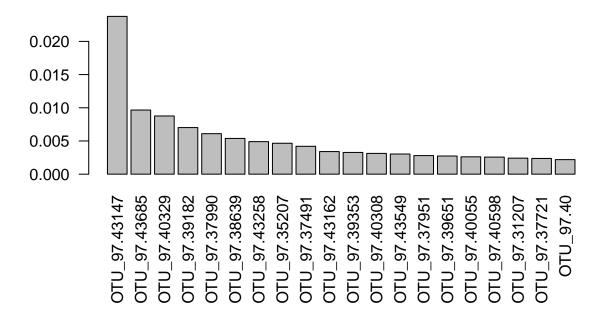

```
HMPv35sub2sub = filter_taxa(HMPv35sub2, function(x) sum(x > 3) > (0.2*length(x)), TRUE)
HMPv35sub2sub
## phyloseq-class experiment-level object
## otu_table()
                 OTU Table:
                                     [ 307 taxa and 316 samples ]
## sample_data() Sample Data:
                                     [ 316 samples by 10 sample variables ]
## tax_table()
                 Taxonomy Table:
                                     [ 307 taxa by 6 taxonomic ranks ]
## phy_tree()
                 Phylogenetic Tree: [ 307 tips and 304 internal nodes ]
## refseq()
                 DNAStringSet:
                                     [ 307 reference sequences ]
HMPv35sub2r <- transform_sample_counts(HMPv35sub2sub, function(x) x / sum(x))</pre>
#class(HMPv35sub2r)
HMPv35sub2fr <- filter_taxa(HMPv35sub2r, function(x) mean(x) > 1e-5, TRUE)
HMPv35sub2frbac = subset_taxa(HMPv35sub2fr, Phylum=="Bacteroidetes")
```

Problem 5

Using your HMPv35sub2frbac object, what is the distribution of the top 20 OTU's?

```
ntaxa(HMPv35sub2frbac)
```

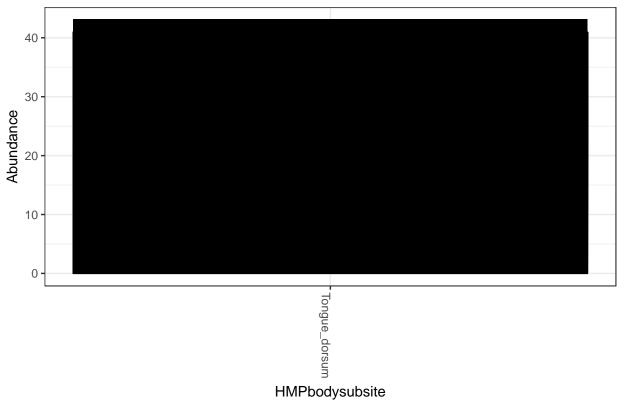

```
## [1] 46
par(mar = c(10, 4, 4, 2) + 0.1)
N <- 20
barplot(sort(taxa_sums(HMPv35sub2frbac), TRUE)[1:N]/nsamples(HMPv35sub2frbac), las=2)</pre>
```

Plot sample abundance by body site for your object HMPv35sub2frbac

```
title <- "Bar Plot; by site; Bacteroidetes only"
plot_bar(HMPv35sub2frbac, "HMPbodysubsite", "Abundance", title=title)</pre>
```

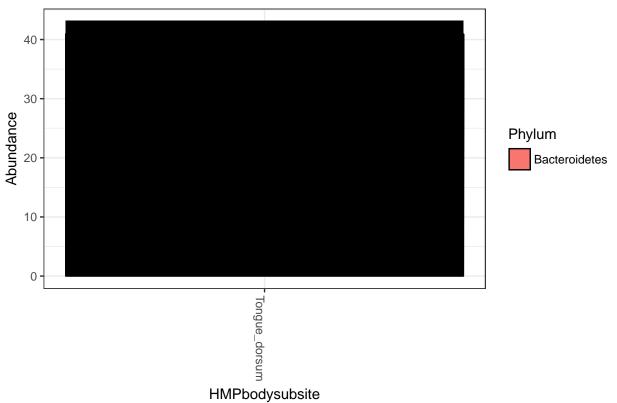

Bar Plot; by site; Bacteroidetes only

You try it with your HMPv35sub2frbac object

```
title <- "Well, that didn't work..."
plot_bar(HMPv35sub2frbac, "HMPbodysubsite", "Abundance", "Phylum", title=title)</pre>
```

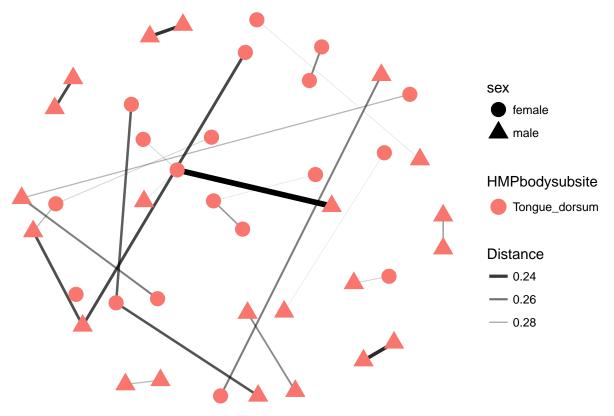

Well, that didn't work...

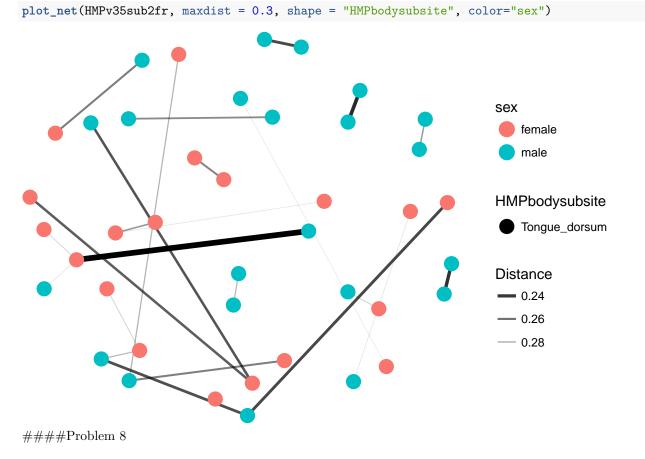

We can use the techniques of network science to illustrate how similar or distant samples are.

Using our filtered object with all phyla, we use the plot_net function to illustrate the "proximity" (or similarity) of samples, while denoting site and the sex of the participant.

```
plot_net(HMPv35sub2fr, maxdist = 0.3, color = "HMPbodysubsite", shape="sex")
```

Let's redo switching which variable is colored and which variable is differentiated by shape.

Which method of display do you like best and why?

#Place your answer here as another comment.
Since we only have one body site, using color to identify body site is not beneficial.
#Therefore, in this case, I prefer the latter method because it highlights the only
#differentiating node characteristic in the graph, sex. However, if we had two body sites,
#it would likely be more beneficial to differentiate body site by color, since that would
#likely be our variable of interest. In our current, single body site data subset, we could use
#both shape AND color to make the sex characteristic really pop out. Then, to improve the
#aesthetics, let's make the nodes larger, and organize it into a circle.
plot_net(HMPv35sub2fr, maxdist = 0.3, shape = "sex", point_size = 7, color="sex", laymeth="circle")
